Abstract

A mobile draining station for motor vehicles is disclosed, comprising a container (1) whose side wall and upper wall can be lifted up and in which carrier arms (6) for receiving a vehicle are arranged in a stationary manner; pivoting arms (13) for removal devices pivotably connected to the rear wall (7) of the container; and at least one door element (8) which is embodied in the rear wall (7) and which can be folded out downwards in order to extend the base of the container. Collectors (10) are positioned in the container in the region in front of the door element. Said collectors can move through the door opening onto the folded-down door element.
